Security Parameters

```
% Galois Field chracteristic
p = 7;
% number of noise variables
m = 2;
% degree of base polynomial
n = 2;
```

Key Pair Construction

Base Polynomial $f(x_0, x_1, \dots, x_m)$

```
% degree of multiplier polynomials
lambda = 1; % linear
% upper limits
ell = [ 1 1 ];
% randomly generate coefficients for f()
c = randi([0 p-1], n+1, ell(1)+1, ell(2)+1);
```

$c_{000}, c_{001}, c_{010}$ and c_{011}

```
disp([c(1,1,1) c(1,1,2) c(1,2,1) c(1,2,2)]);
```

```
     5     1     6     6
```

$c_{100}, c_{101}, c_{110}$ and c_{011}

```
disp([c(2,1,1) c(2,1,2) c(2,2,1) c(2,2,2)]);
```

```
     6     3     4     1
```

$c_{200}, c_{201}, c_{210}$ and c_{211}

%disp(N)
```

Decryption

Evaluate $\phi(s, v_1, \ldots, v_m)$ and $\psi(s, v_1, \ldots, v_m)$

```
phiEval = mod(g(1) * modinv(R0,p) * N0value + Phi + g(lambda+1) * modinv(Rn,p) * Nnvalu
psiEval = mod(h(1) * modinv(R0,p) * N0value + Psi + h(lambda+1) * modinv(Rn,p) * Nnvalu
if ~psiEval
    fprintf('*** Variable psiEval is null\n')
    return;
end
k = mod(phiEval * modinv(psiEval,p), p);

if ~mod(g(2) - k*h(2),p)
```

```
    fprintf('*** Denominator g(2) - k*h(2) is null\n')
    return;
end
news = (k*h(1) - g(1)) * modinv(g(2) - k*h(2), p);
fprintf('Secret is %d, Decrypted value is %d\n', s, mod(news, p));
```

```
Secret is 5, Decrypted value is 5
```

Calculation of Modular Multiplicatve Inverse

Let x be an element of $GF(p)$, its mutiplicative inverse $xinv$ modulo p is such that mod(x*xinv,p) == 1.

```
function xinv = modinv(x,p)
% % modinv: mutiplicative modular inverse of X, mod p
% usage: y = modinv(x,p)
%
% arguments: (input)
%  x - integer(s) to compute the modular inverse in the field of integers
%      for some modular base b.
%
%      x may be scalar, vector or array
%  p - integer modulus. SCALAR only.
%      When p is not a prime number, then some numbers will not have a
%      multiplicative inverse.
%
% arguments: (output)
%  xinv - an array of the same size and shape as X, such that
%      mod(x.*xinv,p) == 1
%
%      In those cases where x does not have a multiplicative inverse in the
%      field of integers modulo p, then xinv will be returned as a NaN.
%
% Examples:
% % In the field of integers modulo 12, only 1,5,7, and 11 have a
% % multiplicative inverse. As it turns out, they are all their own inverses.
%
%  xinv = modinv(0:11,12)
%  xinv =
%   NaN   1   NaN   NaN   NaN    5   NaN    7   NaN   NaN   NaN    11
%
% % In the field generated by modular base 7 (which is prime) only 0 will
% % lack a modular multiplicative inverse.
%
%  xinv = modinv(0:6,7)
%  xinv =
%   NaN     1     4     5     2     3     6
%
% % Works for large (symbolic) integers.
%
%  p = sym('12434354343545235345253')
%  p =
%  12434354343545235345253
%
%  modinv(2,p)
```

```
